

Deployment Stack

Database (MySQL)

- **Provider: Aiven (Free)**
- **Usage:**
 - i. Create a service for MySQL on Aiven
 - ii. Connected it to DBeaver using the URL, USER, PASS
 - iii. Ran schema config files to create the tables and seed the table
 - iv. Used the DB_USER, DB_PASSWORD, DB_URL when connecting it to the Spring App Production.

Backend (API routes)

- **Provider: Render (Free)**
- **Usage:**
 - i. Created a Dockerfile in the server folder (Spring side)
 - ii. Added our host url from Vercel to the allowed CORS policies
 - iii. Created a new web service on Render
 - iv. Used the Dockerfile to set it up
 - v. Added all application.properties env variables to render
 - vi. Deployed it on main branch, and it updates on every push that changes the server of main

Frontend (React/Vite)

- **Provider: Vercel (Free)**
- **Usage:**
 - i. Connected the repository to Vercel
 - ii. Fixed any linting/build errors
 - iii. Added Render's API url as an environment variable
 - iv. Added a vercel.json file that makes it compatible with Vite

v. Vercel reddeploys anytime main is changed
